

Jumping into Statistics: Introduction to Study Design and Statistical Analysis for Medical Research Using JMP Pro Statistical Software

WINTER/SPRING 2021

DR. CYNDI GARVAN & DR. TERRIE VASILOPOULOS

Meet the Instructors

CYNTHIA GARVAN, MA, PHD

Research Professor in Anesthesiology

cgarvan@anest.ufl.edu

TERRIE VASILOPOULOS, PHD

Research Assistant Professor in Anesthesiology
and Orthopaedics and Rehabilitation

tvasilopoulos@anest.ufl.edu

Course Objectives

- Review fundamentals of study design and research methodology
- Understand how to choose best statistical test for your research question
- Practice basic statistical analysis use JMP Pro Software

Course Topics

- Asking a Good Research Question
- Life Cycle of Research and Scientific Method
- Study Design
- Data types and Database Construction
- Descriptive Statistics
- Data Visualization
- Population and Sample, Probability, Statistical Inference
- How to Chose Correct Statistical Method and Run Some Analyses
 - T-tests, ANOVA, Non-Parametric
 - Chi-square, odds ratio, relative risk
 - Regression and Correlation
 - Survival Analysis
 - Test Diagnostics (e.g. sensitivity, specificity, etc.)
- Comparing Statistical Modeling and Machine Learning

Descriptive Statistics

Common descriptive statistics

Mean → sum of all values/sample size (n)

- Average

Median → middle value of all data

- Quantitative

Mode → most frequent value of data

- Quantitative

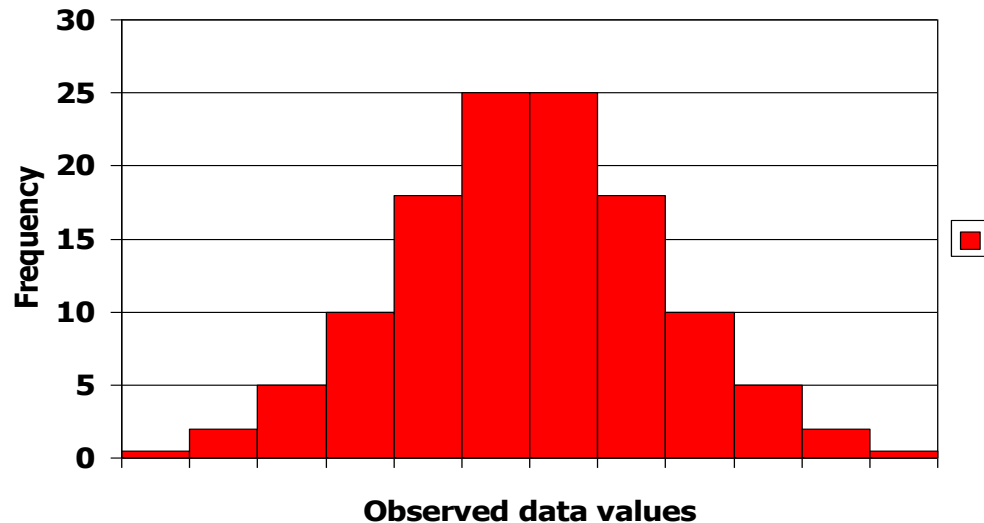

Frequency → % each value is observed in data

- Qualitative (discrete as well)

Central
tendency

Examining Distributions of Quantitative Data

In a perfectly symmetrical normal distribution, the mean, median, and mode are the same value

Skewness

Many common statistical tests assume your data are normal distributed, but sometimes it is not (skewed)

Negative skew

Positive skew

- Mean is more affected by skewness than median
- Can transform data (e.g. take log or square root of values)
- Or use alternative tests

Measures of variability (spread)

Range → highest value - lowest value

Variance is mean of squared deviations (differences) from sample mean

Standard deviation (s) → square root of variance

$$s^2 = \frac{\sum_{i=1}^n (x_i - \bar{x})^2}{n - 1}$$

Low Standard Deviation

Mean height= 60 in, SD = 2 in (60 ± 2)

High Standard Deviation

Mean height= 60 in, SD = 5 in (60 ± 5)

Interquartile Range

25th percentile → 1st quartile (Q1)

50th percentile → 2nd quartile (Q2) Median

75th percentile → 3rd quartile (Q3)

The **inter-quartile range (IQR)** is the difference between the first and third quartiles, i.e.

$$\text{IQR} = Q_3 - Q_1$$

Use Box Plot to Display Median and IQR
